Subject: Compute whether an actual argument is present
From: Van Snyder
Reference: 03-258r1, section 2.8.1; 04-192, 04-357r1 04-393

1 Number

2 TBD

3 Title

4 Compute whether an actual argument is present.

5 Submitted By

6 J3

7 Status

8 For consideration.

9 Basic Functionality

10 Provide a mechanism to compute whether an actual argument is present.

11 Rationale

12 If the presence of an argument controls whether a calculation is performed, and if the desire to perform
13 the calculation is determined by the results of other calculations, one needs to be able to compute
14 whether the argument is present or absent. In Fortran 2003, the way to do this is with an IF construct.
15 But with n arguments, one needs a 2^n-way if-elseif...-else-endif construct with a different one of the 2^n
16 possible combinations of present actual arguments in each branch. It would be more convenient if one
17 could use a syntactic form for an actual argument to calculate whether it is present. It is important that
18 the desired entity, not the value of it, is the actual argument. Otherwise, it would not be useful where
19 the associated dummy argument does not have INTENT(IN).

20 Estimated Impact

21 This is part of the proposal in J3 paper 04-393, whose antecedent was 04-357r1. At J3 meeting 169, the
22 proposal in 04-357r1 was judged to be at 4 on the JKR scale. Surely this proposal, being only part of
23 the previous one, is not larger.

24 Detailed Specification

25 Provide a mechanism to compute whether an actual argument is present.

26 If the condition specifies that the actual argument is present, to be useful in the case the desired entity
27 is not an expression, or is a procedure argument, it, rather than the value of it, must become the actual
28 argument. No matter what syntax is used, if there is no special description it cannot be called a function
29 or operation, because the result would be a value separate from the desired entity itself.

30 If the condition specifies that the actual argument is absent, neither the entity that would otherwise
31 become the actual argument, nor any expressions within it, shall be evaluated. That the condition
32 specifies the entity is considered to be absent might be a proxy for the nonexistence of values necessary
33 for these evaluations.
